Setting the Standard for Worm Gear Technology

From the 1400's, when Leonardo Da Vinci first sketched the concept, to today, the quest for ever-improving technology has driven the world's industries to rely on the double-enveloping worm gear for increased torque throughput, improved accuracy and extended life.

In today's most demanding environments, the engineered solutions and constant innovation for improved industrial motion are the hallmarks that drive us at Cone Drive.

Cone Drive products are available in a wide variety of power ranges. Whether you specify extremely high torque capacity in a quiet, compact package, specialty products that turn two shafts in opposite directions from a single input, or solutions that require absolute zero backlash, Cone Drive Worm Gear Products are nothing short of top of the line.

For more information on the products and solutions that are Engineered to Keep you Moving, contact your Cone Drive representative today.

Solutions for the Aluminum & Steel Industry

David Brown and Benzlers products are available in North America from your Cone Drive representative.
